

**Joint UNEP/OCHA Environment Unit
Environmental Risk Identification
Earthquake Peru- 15 August 2007
Glide number 2007-000133**

Disclaimer

This profile is not a conclusive list. Other risks may be possible from sources that are not readily identifiable. The information sources used are public websites. All efforts are made to screen the websites for accuracy.

Objective:

The objective of the Environmental Risk Identification (ERI) is to alert the UN Country Team after the natural disaster to potential secondary risks posed by large infrastructure and industrial facilities containing hazardous materials located in the affected area. This information can be shared with competent local and national authorities as appropriate. Any actual secondary risk should be addressed at the earliest possible stage.

Event: An earthquake with a magnitude of 7.9 struck off the coast of Peru. Initial tsunami warnings were issued but have been withdrawn.

Summary of findings:

The following large infrastructure and industrial facilities may pose a risk:

Facility	Location	Hazardous material	Hazard
Mining activities			
There are most likely mining activities of copper, silver, gold, phosphate, iron ore and potash.	--	Mercury, Cyanide, Arsenic	Liquid toxic/persistent
General risks of mining activities:			
<i>Possible type of incident</i>	<i>Typical cause of accidents possibly aggravated by the floods</i>	<i>Potential effects</i>	
Tailings dam failure	Poor water management, overtopping, foundation failure, drainage failure, piping, erosion, earthquake	Loss of life, contamination of water supplies, destruction of aquatic habitat and loss of crops and contamination of farmland, threat to protected habitat and biodiversity and loss of livelihood	
Failure of waste rock dump	Instability often related to presence of water (springs, poor dump drainage)	Loss of life, injuries, destruction of property, damage to ecosystems and farmland	
Pipeline failure, e.g. tailings, leach solution	Inadequate maintenance, failure of equipment, physical damage to pipeline	Contamination of soil, water, effects on water users. May not be detected for some time.	
Transport of chemicals to/from site	Inadequate transport procedures and equipment, unsafe packaging, high-risk transportation routes	Contamination of soil, water, effects on water users, aquatic ecosystem damage, threat to human health	
Ground substance	Slope failure, breakthrough to surface	Loss of life, damage to property	
Spills of chemicals at site, e.g. fuel tank rupture, reagent store damage	Poor maintenance, inadequate containment	Contamination of soil and water. Air pollution could have health effects	
Fire	Poor design, unsafe practices in relation to flammable materials	Effects of air pollution on health, property damage	
Atmospheric releases	Inadequate design, failure to follow procedures, inadequate maintenance	Community concern, possible health effects	
Explosions (plant)	Inadequate design, failure to follow procedures, inadequate maintenance	Community concern, loss of life, destruction of property	

Blasting and explosives accidents	Poor practice, unsafe storage and handling	Property damage, risk to life
Public Areas and Services		
Hospitals	-.-	Mercury, radioactive sources, solvents, compressed gases, infectious substances, oxygen, ethylene oxide and various solvents
Drinking Water Filtration plant	-.-	Chlorine, hypochlorite solutions, acids
Sewage Treatment plant	-.-	Chlorine, hydrogen peroxide
Metallurgic and Electronic Industry		
There are most likely industrial activities of processing copper, silver, gold, phosphate, iron ore and potash.	-.-	Sulfuric acid, arsine, sulfur dioxide, Carbon monoxide, nitric oxide, Cyanides,

The Joint UNEP/OCHA Environment Unit :

The Joint UNEP/OCHA Environment Unit is the United Nations mechanism to mobilize and coordinate the international response to environmental emergencies caused by natural disaster, technological accidents and complex emergencies.
